WHAT YOU WILL NEED:

- An avocado
- Three toothpicks
- A glass of water
- Patience

GROW AN AVOCADO TREE FROM THE PIT

INSTRUCTIONS:

1. Your tree will root faster if you use an avocado pit that has dried out for a couple of weeks. Drying the pit will allow it to crack and expose the seed inside the pit. It will also allow the skin around the pit to dry out and peel easier.
2. Peel the skin from around the pit. It will speed up the rooting process.
3. Note the base of the pit. It's the wider side and has a darker circle at the bottom. This is the side of the pit that you'll submerge in water.

4. Use three toothpicks and insert them at the top half of the pit and at a downward angle, as shown.
5. Set your pit into a glass of water, as shown. Make the base of the pit stays submerged. You'll want to freshen the water weekly.

6. In 2-3 weeks, voila! You'll have an avocado pit rooting.
7. In just 5-7 weeks, the roots will have developed enough to pot in soil.
